Last year I visited the Lake of Seven Colors in Bacalar, Mexico. I strained to differentiate the exact shades, trying to find the line where a hue ended and a new color began, trying to account for all seven. Each shade reflected the sky and the clay and the other sediment, and also indicated depth. The deepest purple. Mauveine or Perkin's mauve, was the first synthetic chemical dye. With its invention, came a democratization of color and an aesthetic intensification of the world. After that, anyone, given the right chemical knowledge, could create a color lake. [HD]

The earth has been turned inside out. The ground's contents exhumed, all the dead and compressed species now coating the surface. Creating new surfaces. In parts of the Citarum, in Indonesia, which has the unenviable title of being the most polluted river in the world, there is so much plastic waste that the river has become anoxic. That is, there is no, or little, oxygen in the water column. We have wrapped up life so tightly, sealed it off so effectively, that it can no longer breath. [HD]

There was a recent scare in Indonesia. A story spread that rice being sold in markets was not rice at all. Instead, it was potato starch mixed with polyethylene. The story ran in many newspapers across the country and on the internet. There were reports from different districts, saying some people were sick and had gone to the hospital because of the plastic in their guts. The story, as it turned out, was false. Or, rather, the story was true, but it was about the wrong species. Everyday plastic is eaten, mistaken for food, as it appears in the normal locations, with barely decipherable differences from the regular fare. It is eaten in by corals and turtles and fish and whales and birds. [HD]

<p>It's the impulse to put one thing inside another thing that's working here. A sexual impulse, maybe, and also a way of hiding some things from a ravenous world. This category excludes "cartons, boxes and cases, of corrugated paper" but includes "records sleeves, of paper, paperboard, cellulose wadding or webs of cellulose fibres." We must make meaning out of all differences! Sleeves promise a tight fit, no jangling or bouncing around while in motion. They wrap around discs of black vinyl that they hide from the light and from scratches that would unpattern the patterns that have been carefully constructed and pressed into the record, in order to preserve a series of sounds. 320910-0000 PAINTS AND VARNISHES(INCL ENAMELS & LACQUERS)BASED ON SYNTHETIC POLYMERS,ETC IN AN AQUEOUS MEDIUM,BASED ON ACRYLIC OR VINYL POLYMERS

There is no ocean. There is water, and salt, and microbes, and bacteria, and container ships, and human bodies, and fish, and plants, and car parts, and lighters, and toothbrushes, and persistent organic pollutants, and sharks, and pesticides, and fertilizers, and paint, and molluscs, and corals in aqueous medium. Some of these things dissolve, or will dissolve. Some do not. The ones that do not are sometimes called hydrophobes. These are the molecules, derived from oil, that become your comb or water bottle or holiday centerpiece or tight jeans that make your ass look good. They hate the water. They are not watery beings. And because of that they will continue to persist for an unspecified period of time that we sometimes call "in perpetuity" at the bottom of this aqueous medium. [HD]

But it's not true that it's just the corals and turtles and fish and whales and birds that are eating the plastic. When you distill the sea, you distill everything in the sea. And after the water evaporates salt is left, but so are all the other chemicals and particles that find their way into the water. A recent study found that salt contains pieces of micro-plastic. These are tiny pieces of plastic that are floating around in the oceans, in huge concentrations. They come from our synthetic clothes, which release over 1000 microfibrils with every wash; from cosmetics and toothpaste that contains "microbeads"; and from all the other bags and chairs and dildos and take-out containers that we no longer want and that gradually erode with time. Bruce Mowry, a city engineer for Miami Beach, recently suggested that to solve the city's constant flooding—a problem not just because Miami Beach is barely above sea level, but because all of South Florida is made up of limestone, porous limestone, which means that water seeps in from below—he wanted to find some kind of resin to fill up the holes in the limestone, to make it impermeable. As the sea levels rise, and are predicted to cover much of South Florida in the next fifty years, this plastic-filled limestone could break off and float up, becoming a buoyant island that could drift around in the sea. Perhaps this is where all climate change deniers could go to live out their final years. [HD]

My grandfather worked his whole life for Dupont. He began his career as a chemical engineer and then became a manager. Much of my own life has been shaped by this company, directly through the privilege that his relative wealth earned for my mom and her siblings, and from the easy-at-hand consumer, industrial and medical goods that Dupont produces. My grandfather is now 92 years old. The world that he thought he was creating is not the one he lives in. He now declares himself a communist and urges all us grandkids to become farmers. His forward-looking dreams have ended back where he started, but we cannot recreate from the nostalgia of an old man. Instead, we have to live with the chemicals Dupont continues to leave behind and learn to become responsible for our inheritances, both before and behind us. [HD]
